Comp 5 *Active*

AUDIUM
Ideen, die man hört

Product Information

On the pulse of time - there you'll find **AUDIUM** products!
Such is the Comp 5 Active - an active version of our awarded full range speaker Comp 5. The active version makes a power amplifier obsolete. You can connect your audio source e.g. a network streamer or your PC directly to the loudspeaker.

This is made possible by a specially designed amplifier module. It powers the full-range driver and the oval 6x9" woofer mounted in the bottom plate of the loudspeaker through a 30W and 100W digital amplifier respectively. The integrated DSP performs the work of a classical crossover network and additionally allows an adaptation of the speaker to your listening room and your personal listening preferences.

The AiM software, an interactive user manual makes the installation and set up of the speaker mere child's play.
AUDIUM - on the pulse of time!

Connection

Simply connect the Comp 5 Active with a cinch-cable to your audio source.
This could be a network streamer, a PC, or an iPod or Apple TV (just to name a few). Processing and amplification of the audio signal is performed by the integrated amplifier with a DSP. You can make adaptations of the speaker to your listening room and to your personal preferences. The integrated bass-management extends the deep bass capabilities of the loudspeaker.

In the future, enhancements to the Comp 5 Active will include a digital input and a wireless version, both now being developed and will soon be available.

Power Supply

The 150W power supply is a compact external box. It has been specially optimised for the use with the Comp 5 active.

The separation of the power supply from the loudspeaker prevents interspersion and allows additional flexibility.

The auto-Standby circuit of the amplifier reduces the current consumption when you are not listening to music.
We also take care of the environment!

Software

AiM - the AUDIUM interactive Manual is a software for your PC which combines user manual and configuration software in one application.

You will get to know everything important about your loudspeaker and you can also configure the amplifier.
All without the need of extra cabling! Simply connect your PC with your audio-system, switch the speaker into the configuration mode, and there you go!
